Fixeon adds the 150mm Phoenix™ to it's line of single wafer shippers

AUSTIN, TX November 1, 2008: Fixeon is proud to announce the addition of the 150mm Phoenix™ to its successful line of single wafer shippers. The 150mm product joins the 300mm Phoenix SWS, and is available immediately to the global semiconductor industry.

The Phoenix™ product line, which is an injection molded single wafer shipper (SWS), incorporates many high performance features, and provides the best wafer protection solution for the industry. Fixeon uses a high-purity, low-ionic thermoplastic polycarbonate, which gives customers a durable cleanroom compatible product with a longer life cycle.

The Phoenix™ SWS has the lowest profile in the industry, resulting in secure stacking with less storage space. Wafers are stabilized with an elastomeric gasket which is attached to a removable lens that holds the wafer stationary, and internally seals the wafer from potential external contamination or physical shock damage. Our unique advantage over other SWS products is that our customers can perform optical inspection on the wafer without removing it from the SWS package. The 150mm Phoenix™ is available with an Natural (clear) or ESD (black) base for static protection.

Fixeon's customer-focused attitude is committed to exceeding expectations by providing a total innovative solutions for the global semiconductor industry to protect silicon wafers during processing, storage and transportation.
